

Results from STEP 1: $\gamma_i - \gamma_i^{true} = q(\gamma_i^{true})^2 + m\gamma_i + c$

Skymaker
simulations

Bulge + disk
simulations
galaxies and 6
different
PSFs.

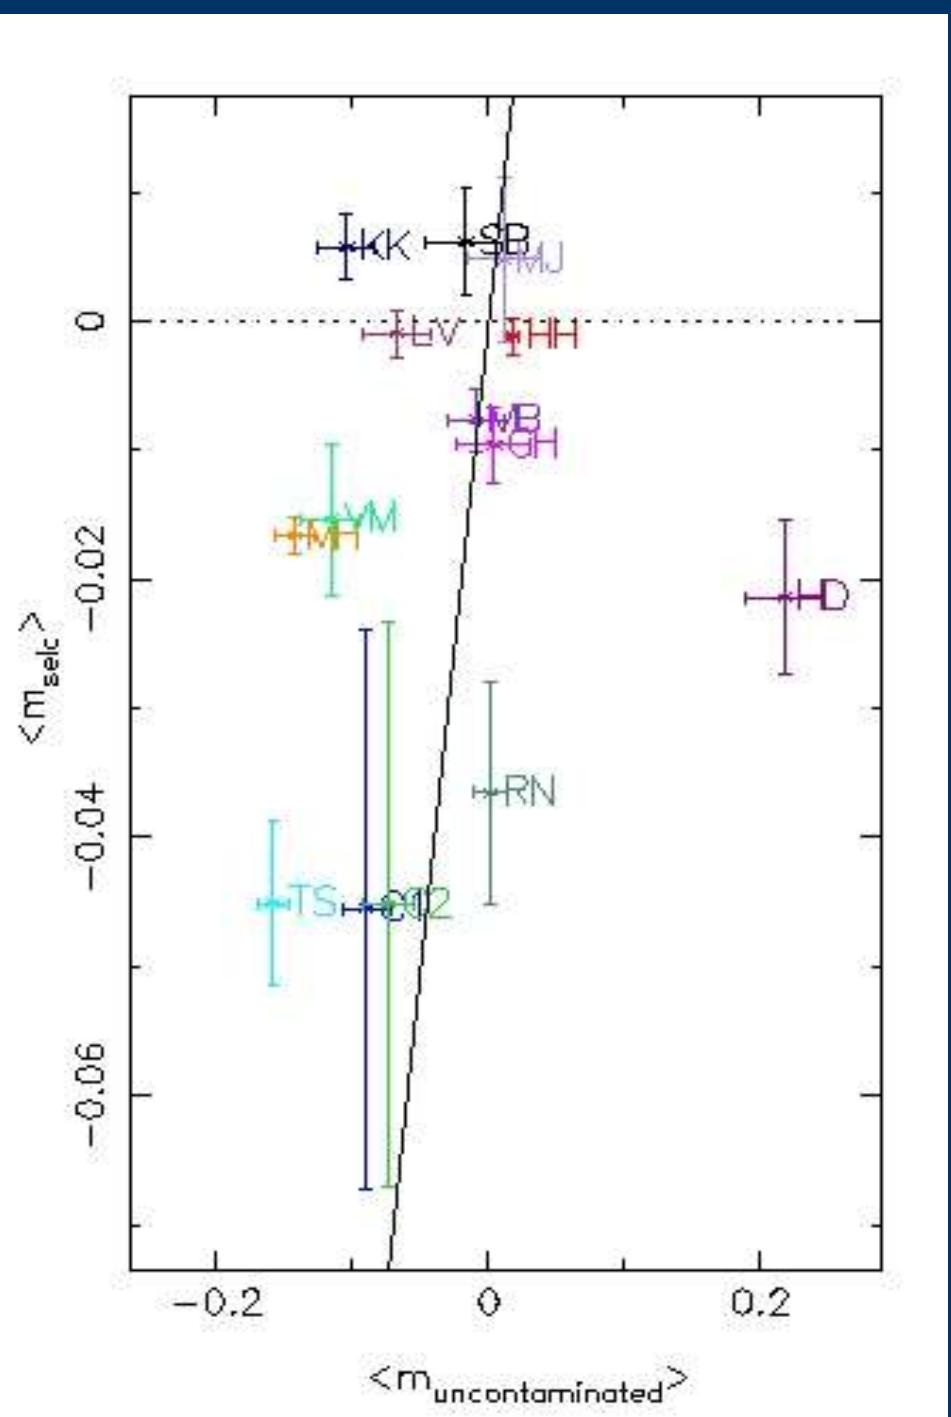

$\langle m \rangle$ = calibration bias

$|\langle q \rangle|^2$ = a non-linear
response to shear

Selection biases, stellar and false object contamination

- $m(\text{selc})$ – do the selected galaxies source ellipticities average to zero?
- $m(\text{uncontaminated})$ – the stellar and false galaxy contamination is removed from the catalogues
