

Constraining the escape of ionizing photons from galaxies at $z > 6$ with JWST

Erik Zackrisson

Uppsala University, Sweden

Christian Binggeli, Kristian Finlator, Nick Gnedin,
Jan-Pieter Paardekooper, Ikkoh Shimizu, Akio Inoue,
Hannes Jensen, Genoveva Micheva, Kristiaan Pelckmans

Take-home message

JWST/NIRSpec will be able to measure the escape of ionizing radiation from galaxies at redshift $z \approx 6-9$ – and this project can go piggy-back on other NIRSpec surveys!

Zackrisson et al. 2013, *ApJ*, 777, 39

Jensen et al. 2016, *ApJ*, in press (arXiv1603.09610)

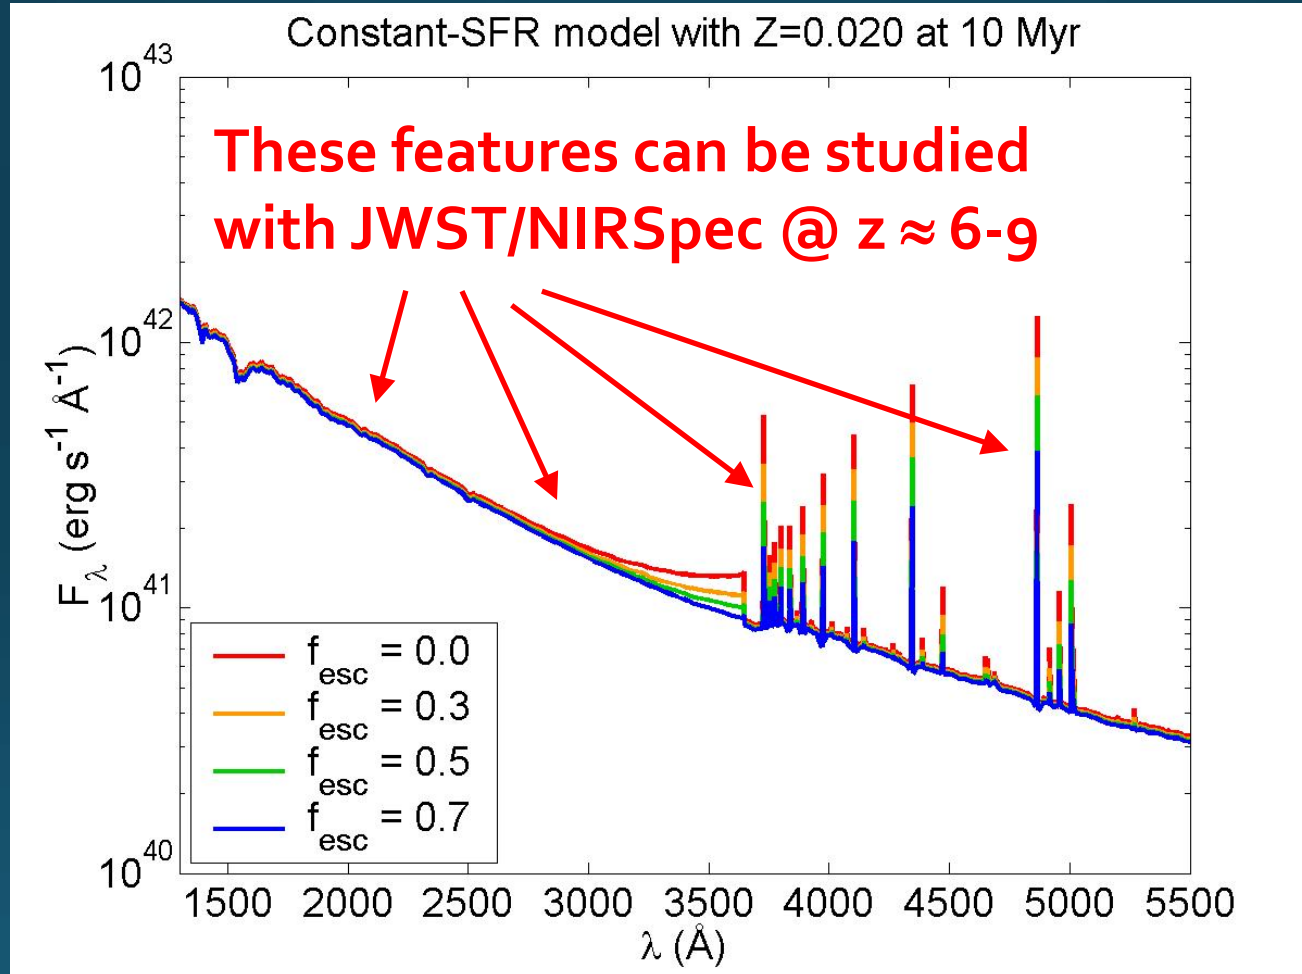

So, you want galaxies to reionize the Universe? Then you need...

1) Lots of star-forming galaxies at redshifts $z > 6$

2) Escape of ionizing photons (Lyman continuum) from galaxies into the IGM

Indirect signatures of LyC leakage

How does this work?

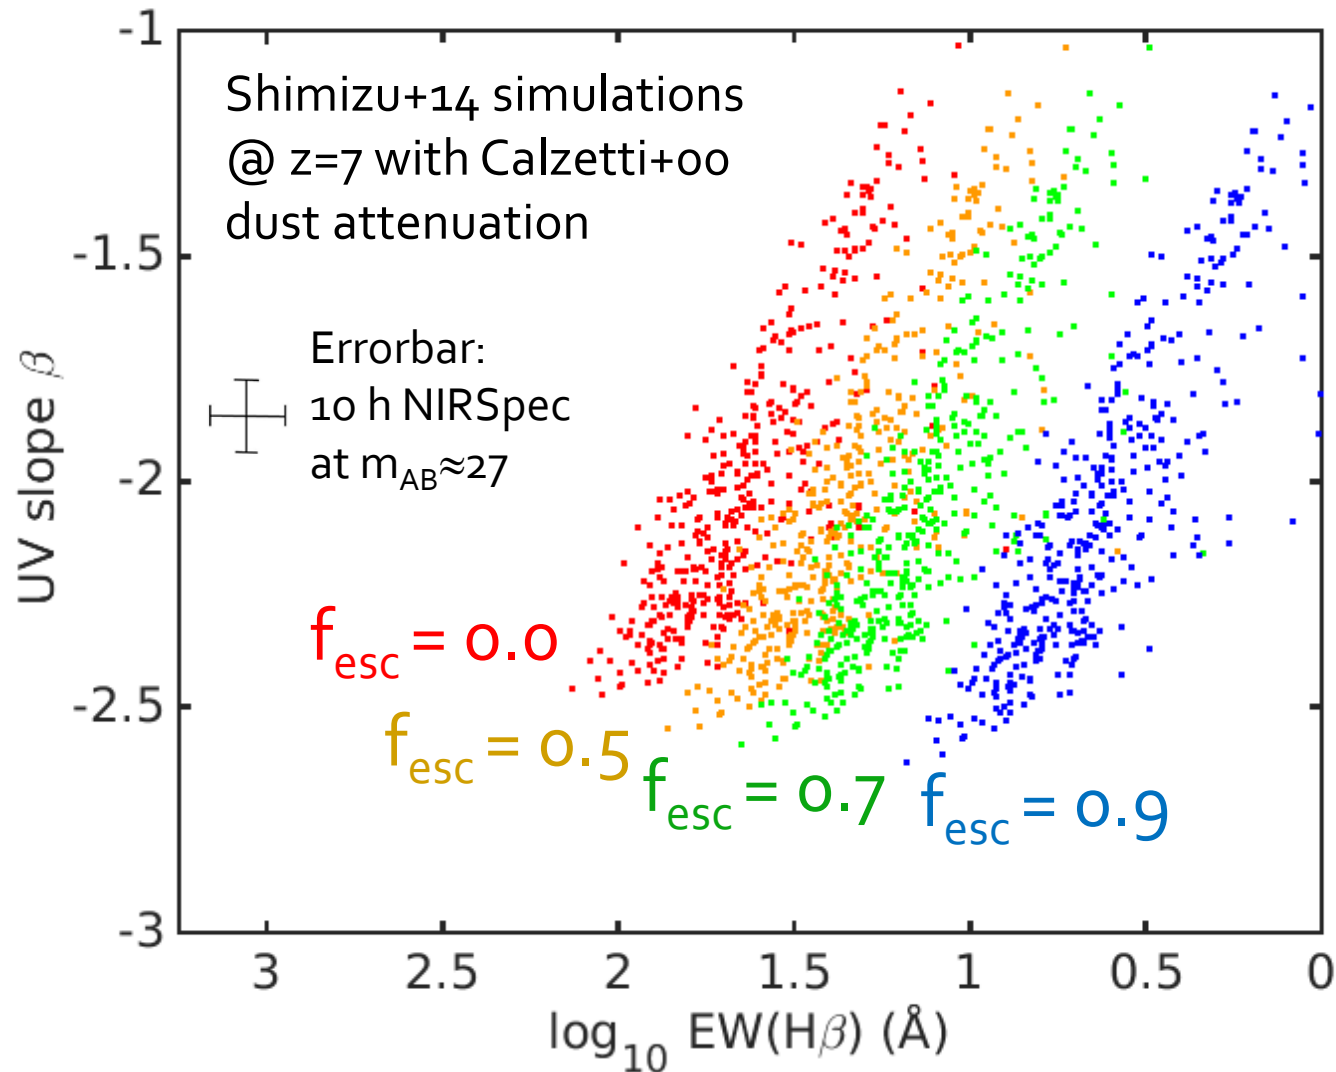

Young stars

Lyman continuum
photons from young
stars captured by gas
→ **Nebular emission**

If some of the LyC photons escape without ionizing the ISM → **Less nebular emission!**

Simple diagnostics: UV slope & H β

How well can we measure f_{esc} ?

LYman Continuum ANalysis project:

Galaxy simulations + Yggdrasil SED models (stars, gas, dust; Zackrisson et al. 2011) + observational errors →

Mock spectra of high- z galaxies with Lyman continuum leakage

Simulations suites:

CROC (Gnedin 2014)

FiBY (Paardekooper et al. 2015)

Finlator et al. (2013)

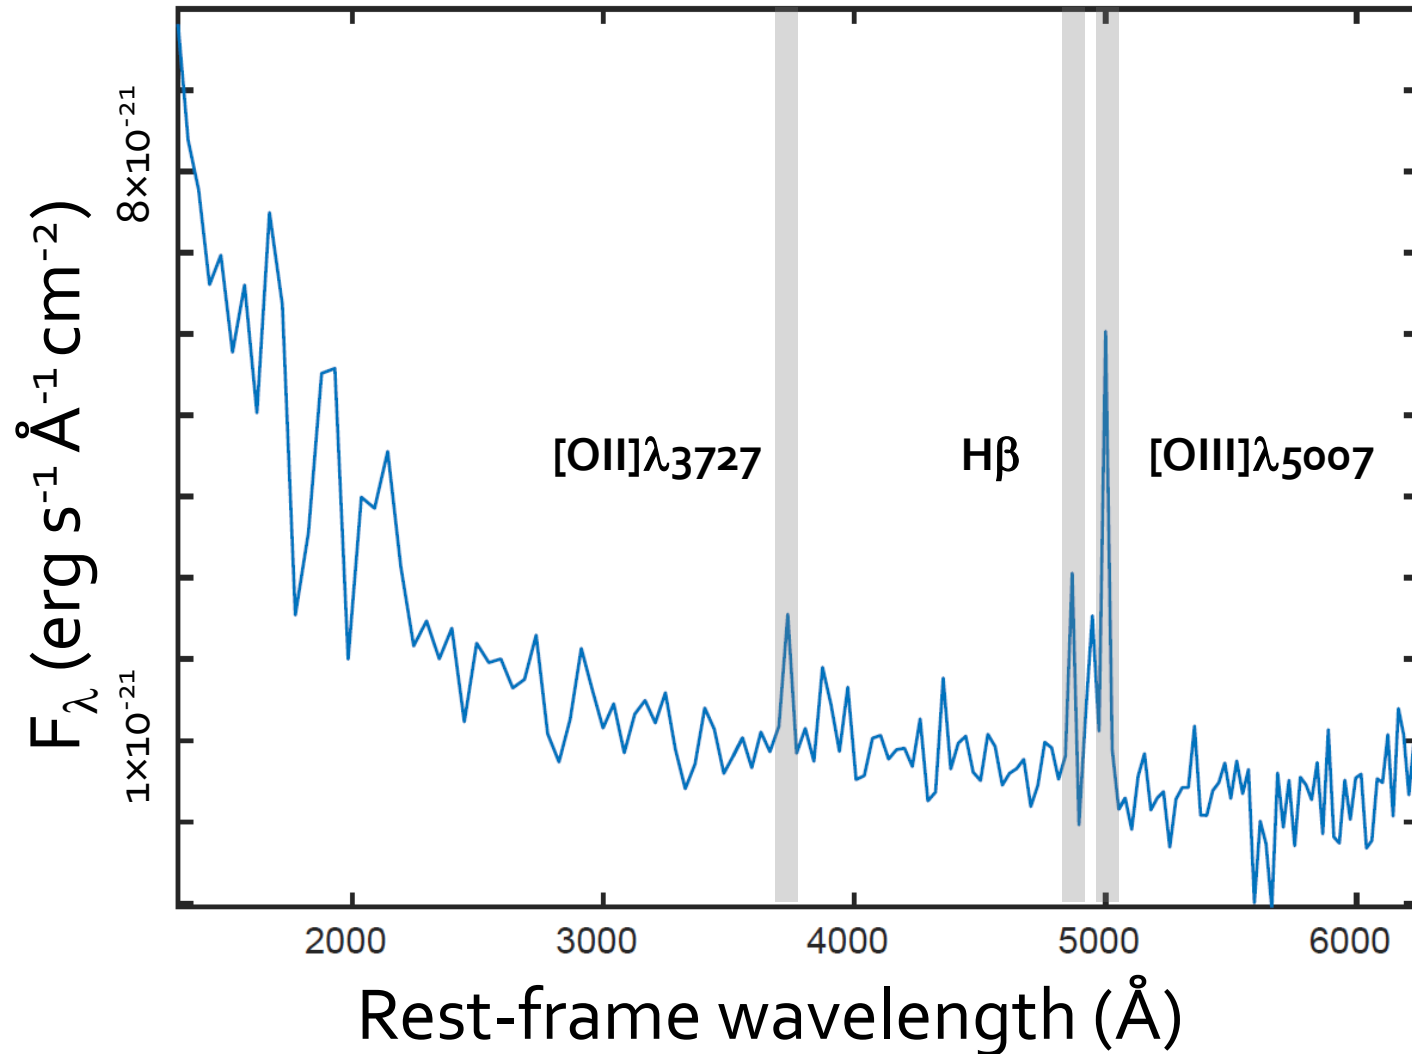

Shimizu et al. (2014)

Highly realistic SEDs for high-redshift galaxies publicly available:

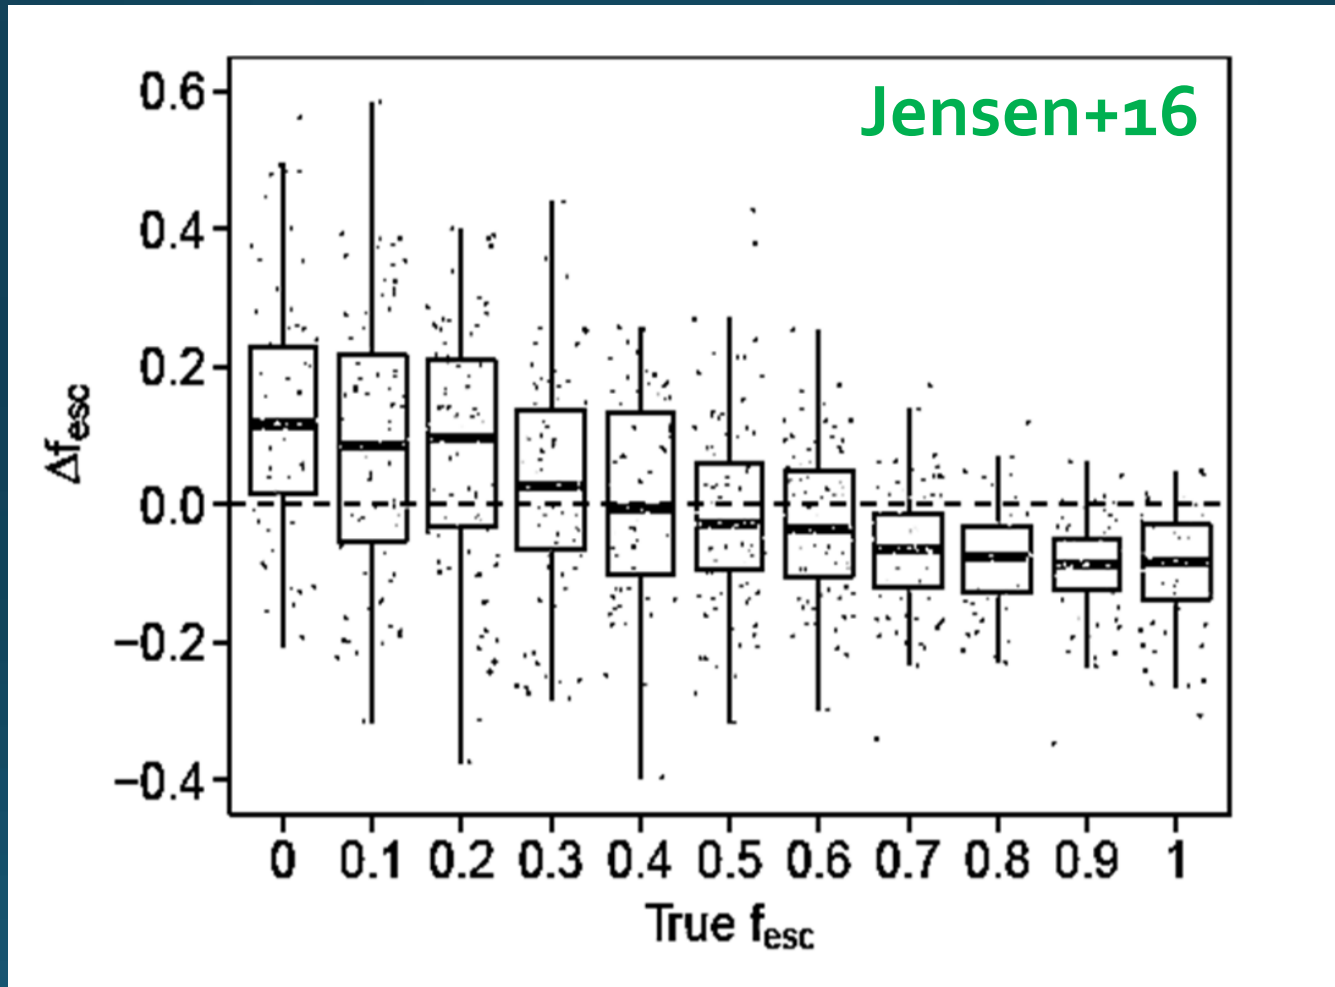

www.astro.uu.se/~ez/lycan/lycan.html

Example of LYCAN mock spectrum

3h NIRSPEC, R=100 spectrum of $m_{AB} \approx 28$ galaxy at $z=7$

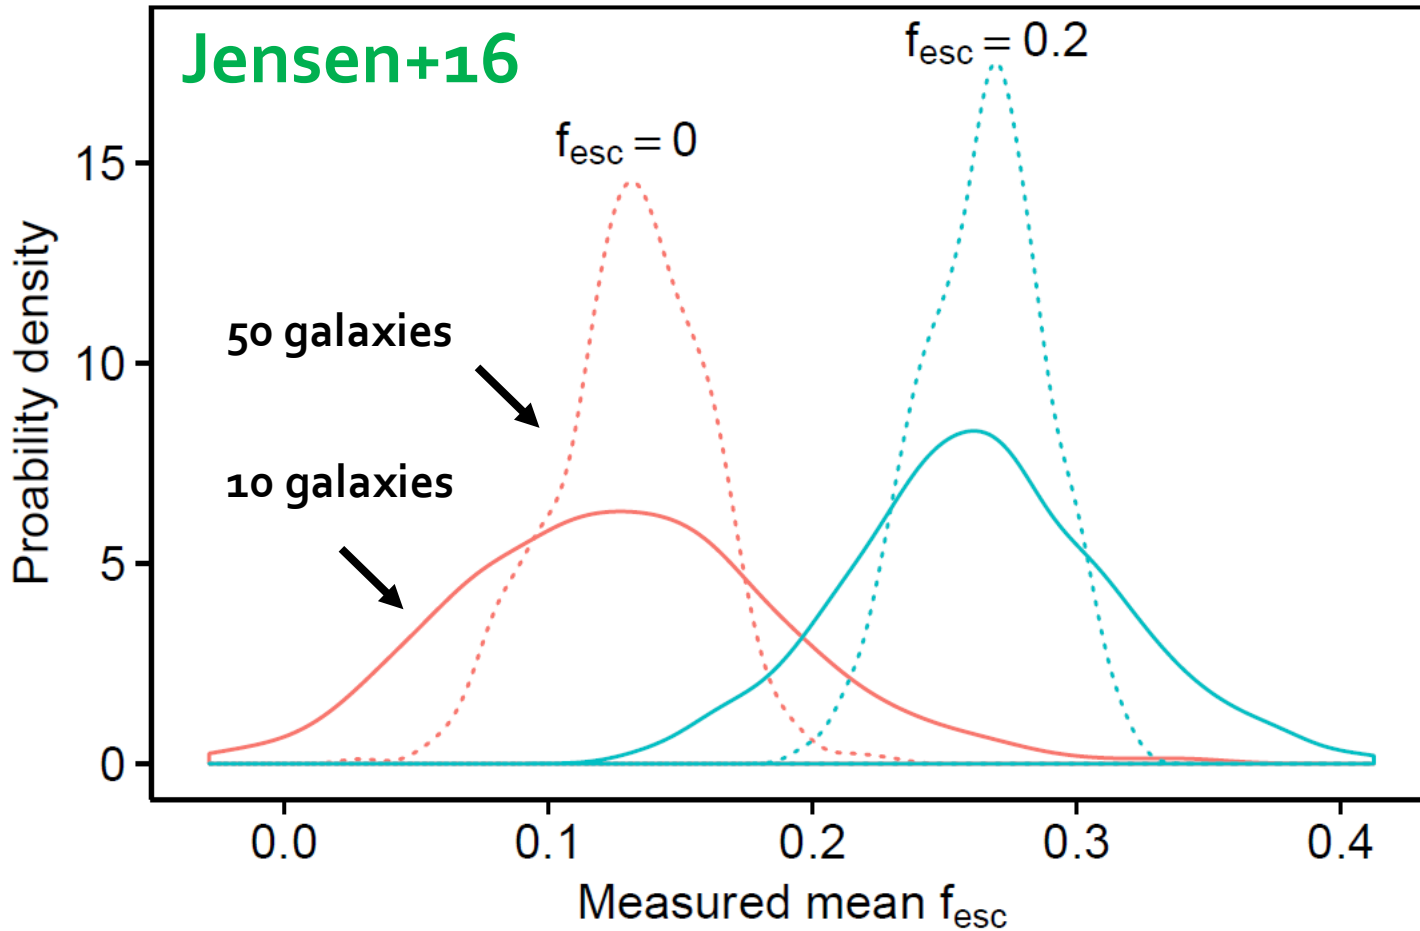

SED analysis using machine learning algorithms

3 h NIRSPEC, $R=100$ spectra of $m_{\text{AB}} \approx 28$ galaxies at $z=7$

SED analysis using machine learning algorithms

What you can (and cannot) hope to get

No problem:

- Identification of individual galaxies with extreme LyC leakage ($f_{\text{esc}} > 0.5$)
- Typical LyC escape fraction from sample of ≈ 50 galaxies (to within $\Delta f_{\text{esc}} \approx 0.1$)

Problematic:

- Reliable estimates of f_{esc} for individual galaxies with $f_{\text{esc}} < 0.3$

Ongoing work

- Handle on LyC leakage mechanisms:
Radiation-bounded nebulae with holes vs.
density-bounded nebulae
- Constraints on LyC production efficiency
times the escape fraction ($\xi_{\text{ion}} f_{\text{esc}}$)
- What if you combine NIRSspec data with
MIRI photometry?
- Calibration/test of technique using galaxies
with direct LyC detections at $z \approx 3$

Summary

- The escape of ionizing photons from galaxies at $z > 6$ is crucial for galaxy-dominated reionization
- JWST/NIRSpec can constrain the escape of ionizing radiation from galaxies up to $z \approx 9$
- Project can go piggy-back on any NIRSpec survey of high-redshift galaxies
- Publicly available JWST mock spectra for high- z galaxies: www.astro.uu.se/~ez/lycan/lycan.html
